

Documentation of analysis of employees data Power BI reports

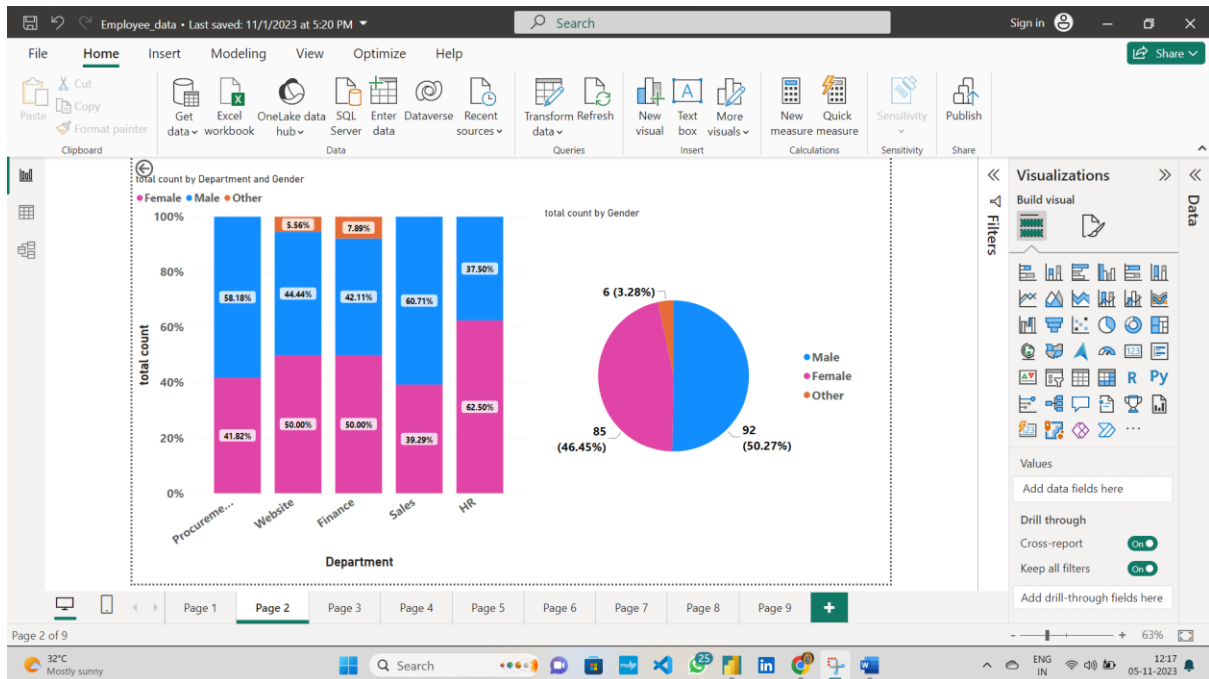

Introduction:

This analysis is based on a test data, assuming it as employees data of a company which have offices in India and New Zealand. In these reports, I analysed and visualized data based on some factors namely total count, Salary, data-joined, department, gender, rating, country etc. For these things, I have created some measures also such as total count, average salary, minimum salary etc. I preferred measures over calculated columns because these will not add any additional data to tables and decreases storage utility.

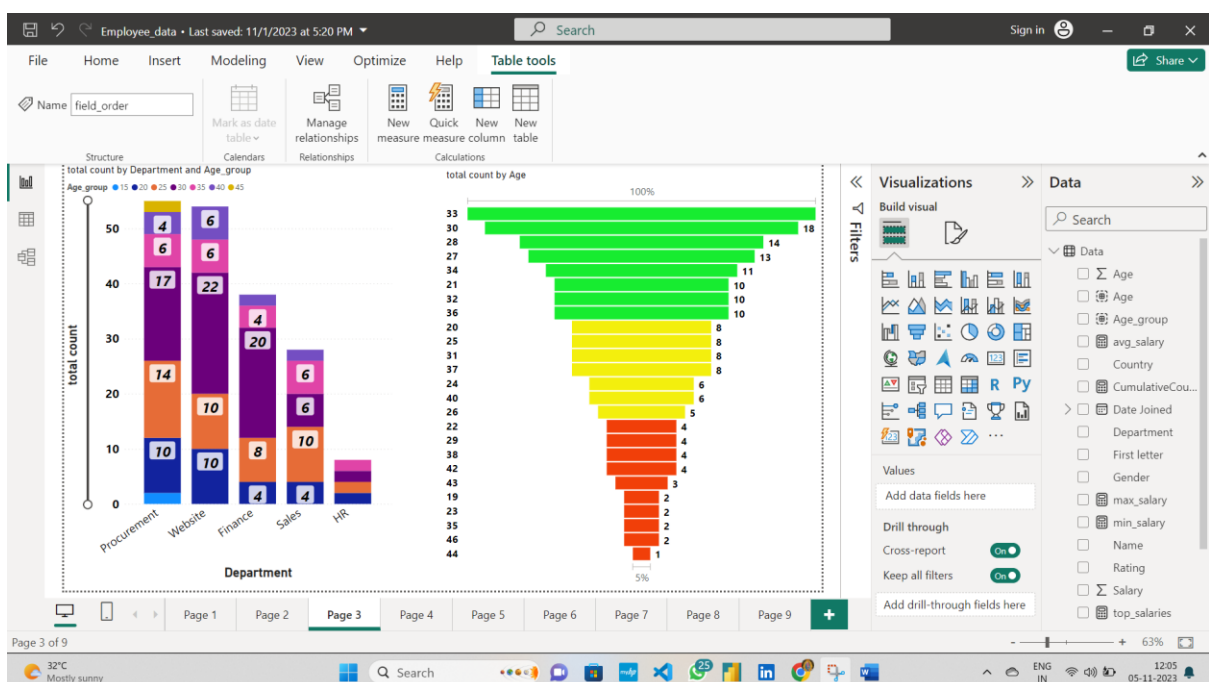

Page1- Total number of employees are divided based on department.

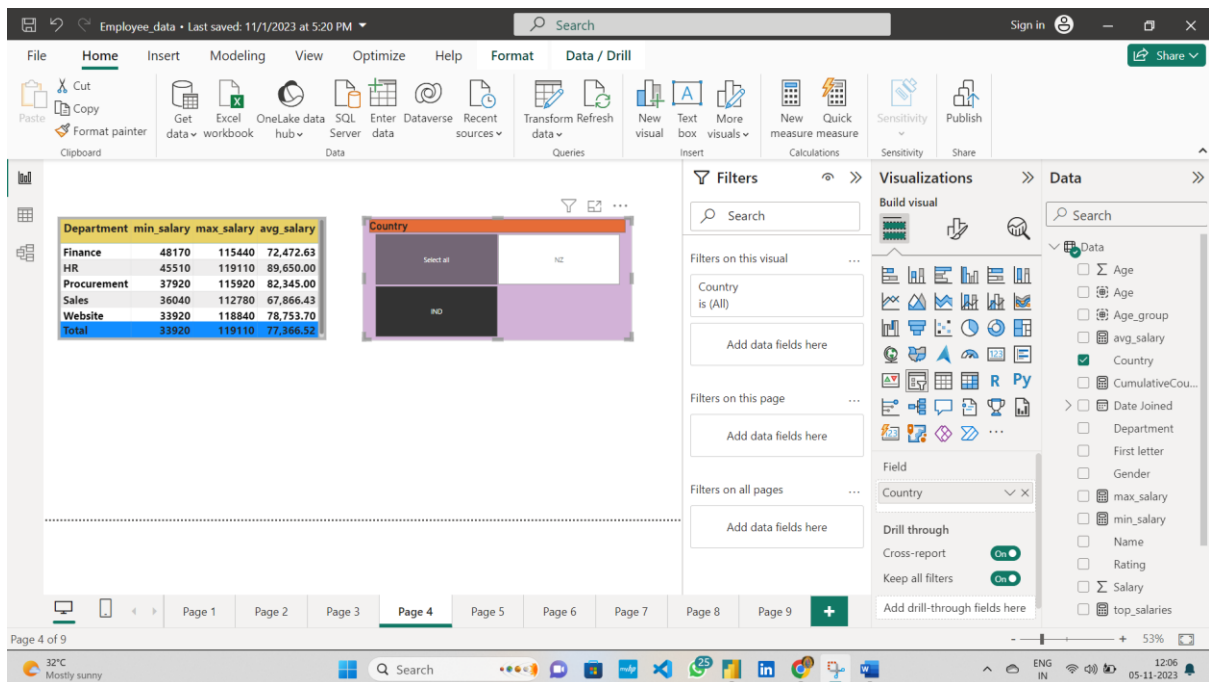

Page2-toatal number of employees shown based on department and gender.

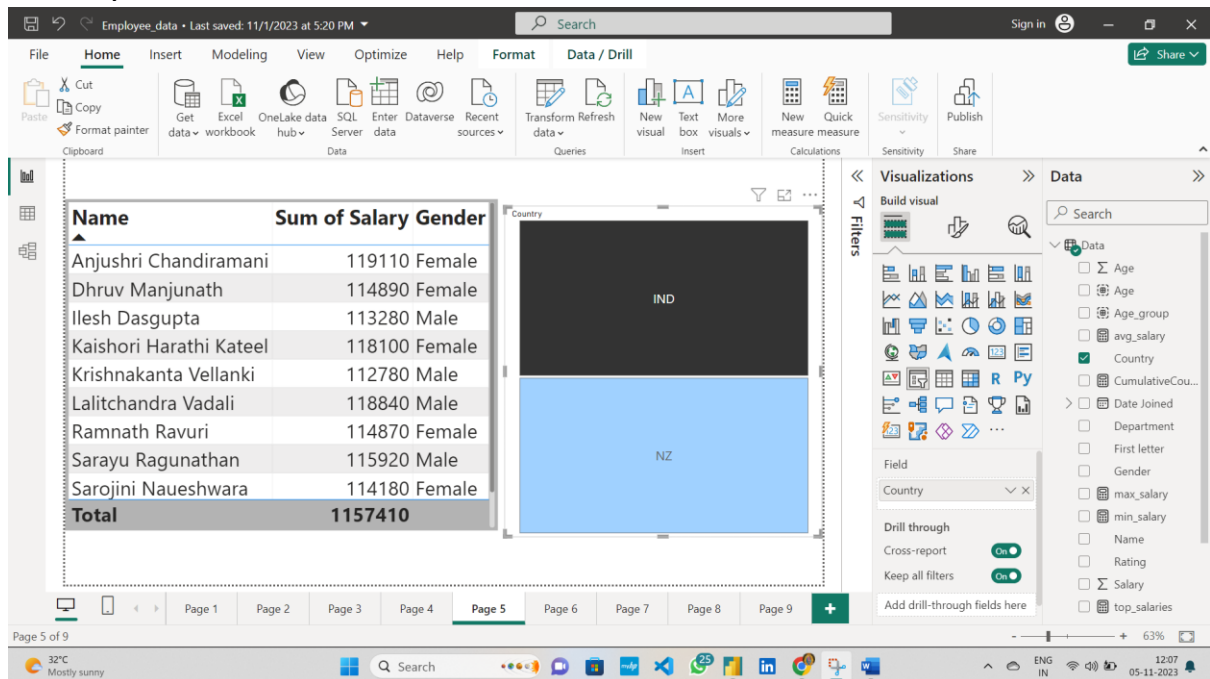

Page3-total number of employees based on department and age.

Page4- maximum, average, minimum salaries of each department and a slicer is added to filter results base on country.

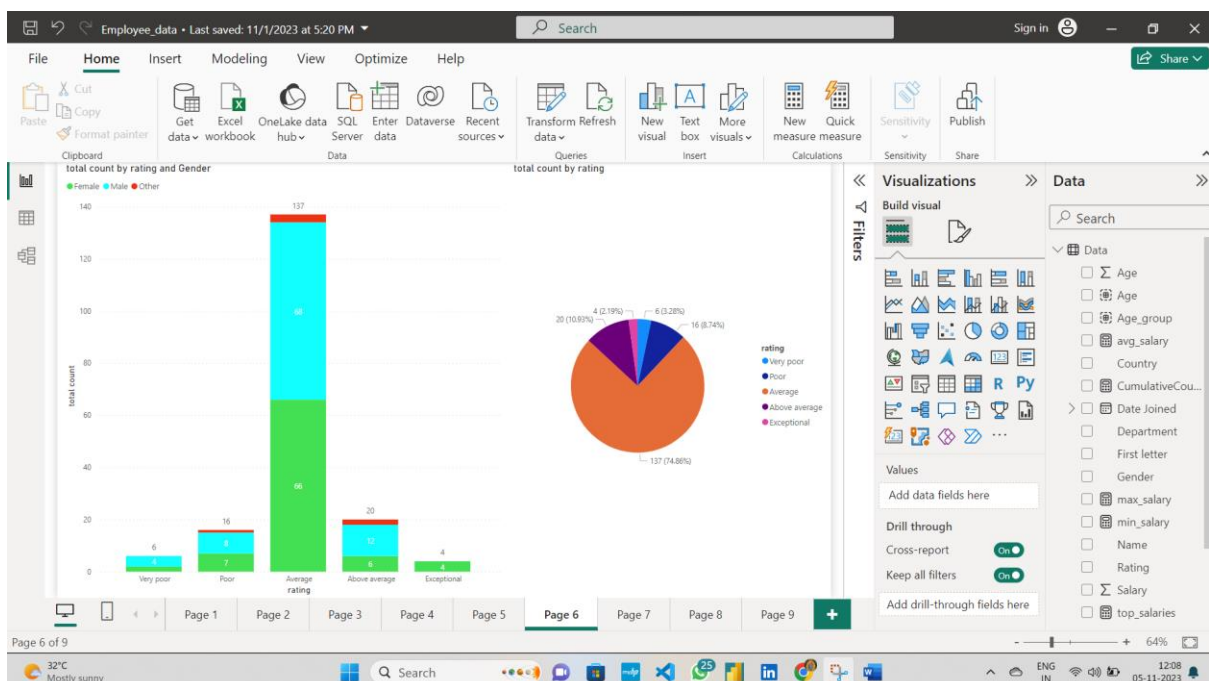

Page5- Top 10 salaries earning persons and details and can be filtered based on country.

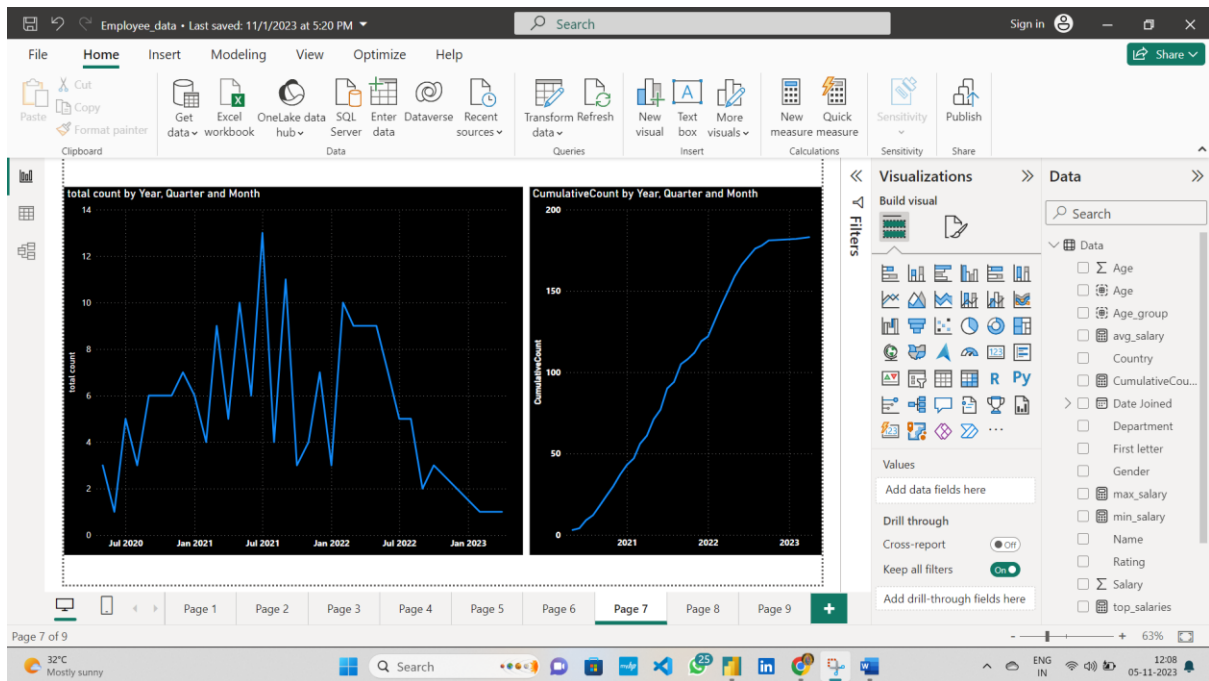

Page6- number of employees based on their rating and gender. For getting this order for rating, I added anew table named field_order and mapped its rating column with rating column of data table.

The order of rating column in field_order table is related to order column which is an integer in the same table. You find model view images at last of this document.

Page7- number of employees hired across 3 years, right side view is cumulative count of employees hired. We can drill this view from years to quarters and months.

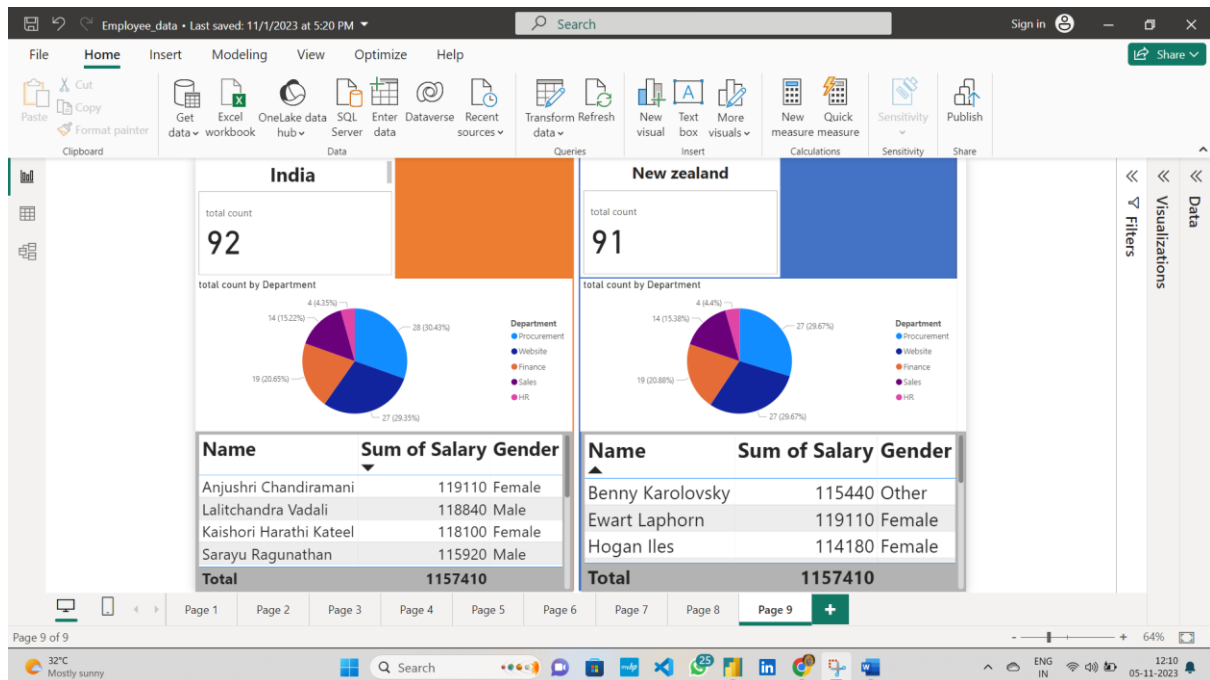

Page8- Classification of employees base on the first letter in their names and a score card is added to know number of employees of particular selection in slicer. For getting first letter from names, I have added a new column to data table by extracting first letter from name column. You can observe it in table view of data which image is placed at last of document.

The screenshot displays the Microsoft Power BI Desktop interface. The main window shows a data table with columns: Name, Rating, Department, and Sum of Salary. The table lists various employees and their details. A score card visualization is placed over the table, showing a 'total count' of 14. The interface includes a ribbon with tabs like File, Home, Insert, Modeling, View, Optimize, Help, Format, and Data / Drill. The Data / Drill tab is active, showing a list of fields and a search bar. The bottom status bar indicates 'Page 8 of 9'.

Name	Rating	Department	Sum of Salary
Abhishek Prasadshen	Average	Sales	\$5700
Agnes Carlotti	Average	Marketing	\$1750
Agnes Akerman	Average	Finance	\$5500
Akane Gillott	Average	Procurement	\$3850
Alex Kasper	Average	Sales	\$4950
Alice Nimsch	Average	Marketing	\$4850
Amanda Kulkarni	Average	Procurement	\$2650
Amankumar Rajadharan	Average	Marketing	\$5240
Anisha Krimson	Average	Marketing	\$9500
Arjun Chatterjee	Average	HR	\$1950
Arvind Prasad Venkatesh	Average	Sales	\$5240
Ashish Pillay	Average	Procurement	\$5400
Aulia Pothireddy	Average	Finance	\$9400
Ayaz Chakrabarti	Average	Marketing	\$5400
Total			\$65490

Page9- Total number of employees, top 10 salaries earning employees and their details are shown in this report and classified based on country.

Model view:

I added a table named field_order and its rating field is mapped to rating field in data table to sort the rating field order in a desired way based on order field(integer) in field order table.

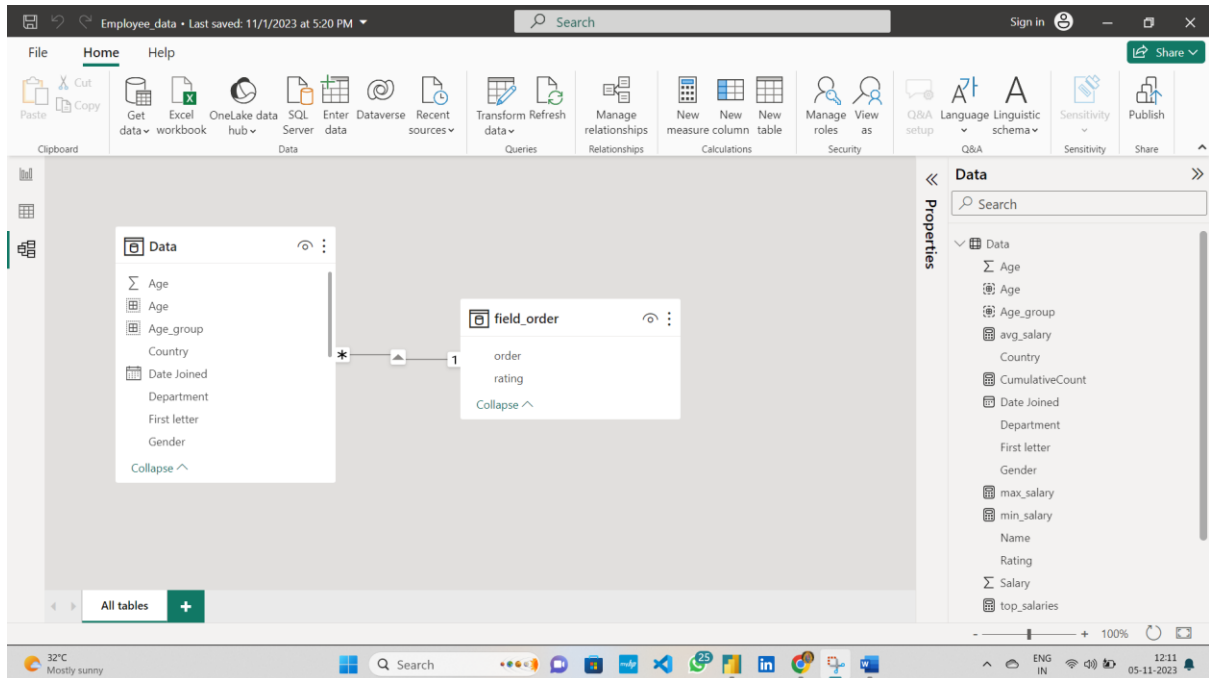

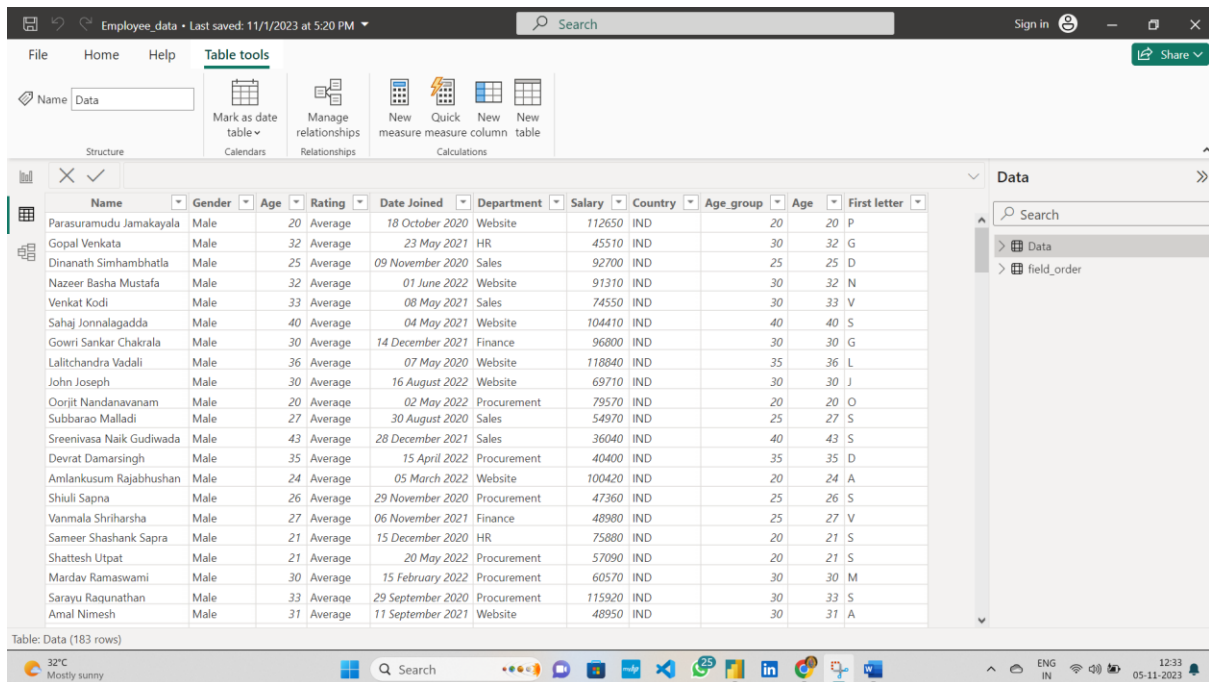

Table view:

Below images shows table view of used data for Power BI reports.

Conclusion:

In these reports, Employees data analysis and visualization is done based some important factors such as count, salary etc.

For this analysis I have used,

measures mostly in reports because those will not add additional data to reports and hence storage optimization is possible.

slicers to filter data based on country rather than directly filter it, it will help to users to interact with data.

score cards less whenever there is a need to show number of employees for a particular filter condition.

Added an additional table and mapped its rating column which is related to order column[integer] of same table with main table rating column for getting desired order of data during data visualization.

Remaining graphs, tables, pie-charts etc are used based on their need in data visualization.
